Branching ratios: our Winkler implementation vs the published reference table

e^+e^-

$\mu^+\mu^-$

$\tau^+\tau^-$

$\pi\pi$ ([W]: isoscalar, i.e. $\pi^+\pi^- + \pi^0\pi^0$)

$K\bar{K}$ ([W]: isoscalar, i.e. $K^+K^- + K^0\bar{K}^0$)

$4\pi,\ \eta\eta,\ \rho\rho,\ \ldots$

gg

$s\bar{s}$

$c\bar{c}$

$b\bar{b}$ (not in the reference table)

$\gamma\gamma$ (not in the reference table)

branching ratio

m_S [GeV]

this work (Winkler)

reference table

Pi pi / K K: this work uses the digitised Winkler curve, which is the isoscalar rate (the CG coefficient of the isoscalar projection is absorbed into his form factors), i.e. pi+pi- + pi0pi0 and K+K- + K0K0bar. The reference columns are the single charge states pi+pi- and K+K-, so those two panels differ by 1.5 and 2.0 by construction. The reference table has neither gamma-gamma nor b bbar.
